

# Chapter 9: Virtual Memory

---

# Chapter 9: Virtual Memory

---

- Background
- Demand Paging
- Copy-on-Write
- Page Replacement
- Allocation of Frames

# Objectives

---

- To describe the benefits of a virtual memory system
- To explain the concepts of demand paging, page-replacement algorithms, and allocation of page frames

# Background

---

- **Virtual memory** – separation of user logical memory from physical memory.
  - Only part of the program needs to be in memory for execution
  - Logical address space can therefore be much larger than physical address space
  - Allows address spaces to be shared by several processes
  - Allows for more efficient process creation
- Virtual memory can be implemented via:
  - Demand paging
  - Demand segmentation

# Virtual Memory That is Larger Than Physical Memory

# Virtual-address Space

# Shared Library Using Virtual Memory

# Demand Paging

---

- Bring a page into memory only when it is needed
  - Less I/O needed
  - Less memory needed
  - More users
  - Faster response
- Page is needed  $\Rightarrow$  reference to it
  - invalid reference  $\Rightarrow$  abort
  - not-in-memory  $\Rightarrow$  bring to memory
- **Lazy swapper** – never swaps a page into memory unless page will be needed
  - Swapper that deals with pages is a **pager**

# Transfer of a Paged Memory to Contiguous Disk Space

# Valid-Invalid Bit

- With each page table entry a valid–invalid bit is associated (**v**  $\Rightarrow$  in-memory, **i**  $\Rightarrow$  not-in-memory)
- Initially valid–invalid bit is set to **i** on all entries
- Example of a page table snapshot:

Frame #	valid-invalid bit
	<b>v</b>
	<b>v</b>
	<b>v</b>
	<b>v</b>
	<b>i</b>
....	
	<b>i</b>
	<b>i</b>

page table

During address translation, if valid–invalid bit in page table entry is **i**  $\Rightarrow$  page fault

# Page Table When Some Pages Are Not in Main Memory

valid-invalid bit	
frame	bit
0	4 v
1	i
2	6 v
3	i
4	i
5	9 v
6	i
7	i

page table

# Page Fault

- If there is a reference to a page, first reference to that page will trap to operating system:

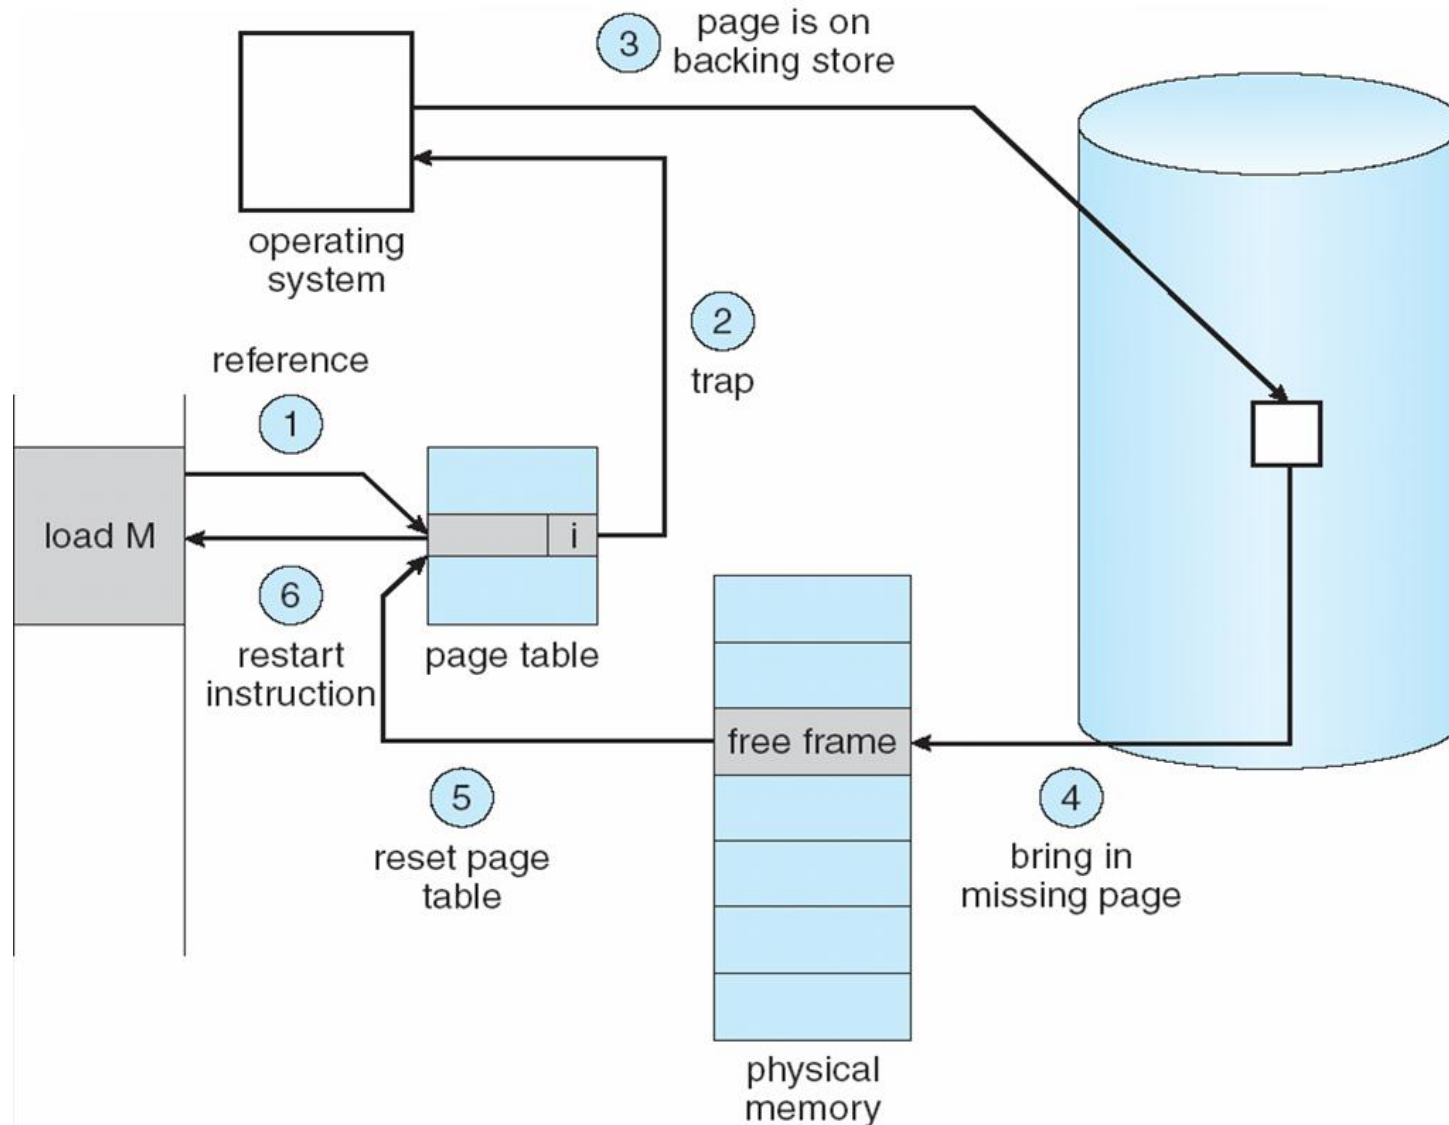

## page fault

1. Operating system looks at another table to decide:
  - Invalid reference  $\Rightarrow$  abort
  - Just not in memory
2. Get an empty frame
3. Swap that page into the frame
4. Reset tables
5. Set validation bit = **v**
6. Restart the instruction that caused the page fault

# Steps in Handling a Page Fault

# Performance of Demand Paging

- Page Fault Rate  $0 \leq p \leq 1.0$ 
  - if  $p = 0$  no page faults
  - if  $p = 1$ , every reference is a fault

- Effective Access Time (EAT)

$$\begin{aligned} \text{EAT} = & (1 - p) \times \text{memory access} \\ & + p (\text{page fault overhead} \\ & \quad + \text{swap page out} \\ & \quad + \text{swap page in} \\ & \quad + \text{restart overhead}) \end{aligned}$$

# Demand Paging Example

---

- Memory access time = 200 nanoseconds
- Average page-fault service time = 8 milliseconds
- $$\begin{aligned} \text{EAT} &= (1 - p) \times 200 + p (8 \text{ milliseconds}) \\ &= (1 - p) \times 200 + p \times 8,000,000 \\ &= 200 + p \times 7,999,800 \end{aligned}$$
- If one access out of 1,000 causes a page fault, then  
EAT = 8.2 microseconds.  
This is a slowdown by a factor of 40!!

# Process Creation

---

- Virtual memory allows other benefits during process creation:
  - Copy-on-Write
  - Memory-Mapped Files (later)

# Copy-on-Write

---

- Copy-on-Write (COW) allows both parent and child processes to initially *share* the same pages in memory

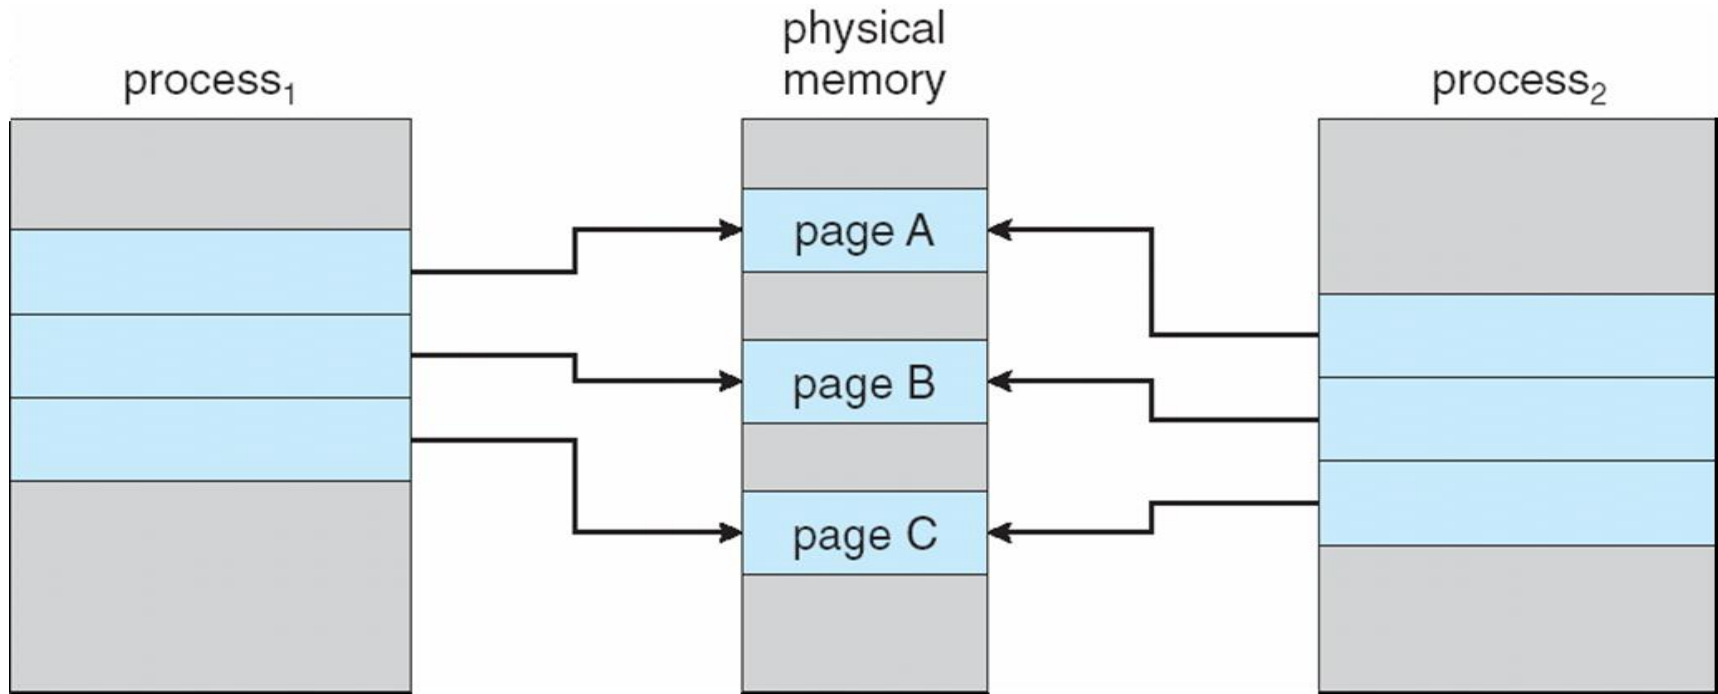

(If either process modifies a shared page, only then this page is copied.)

- COW allows more efficient process creation as only modified pages are copied
- Free pages are allocated from a **pool** of zeroed-out pages

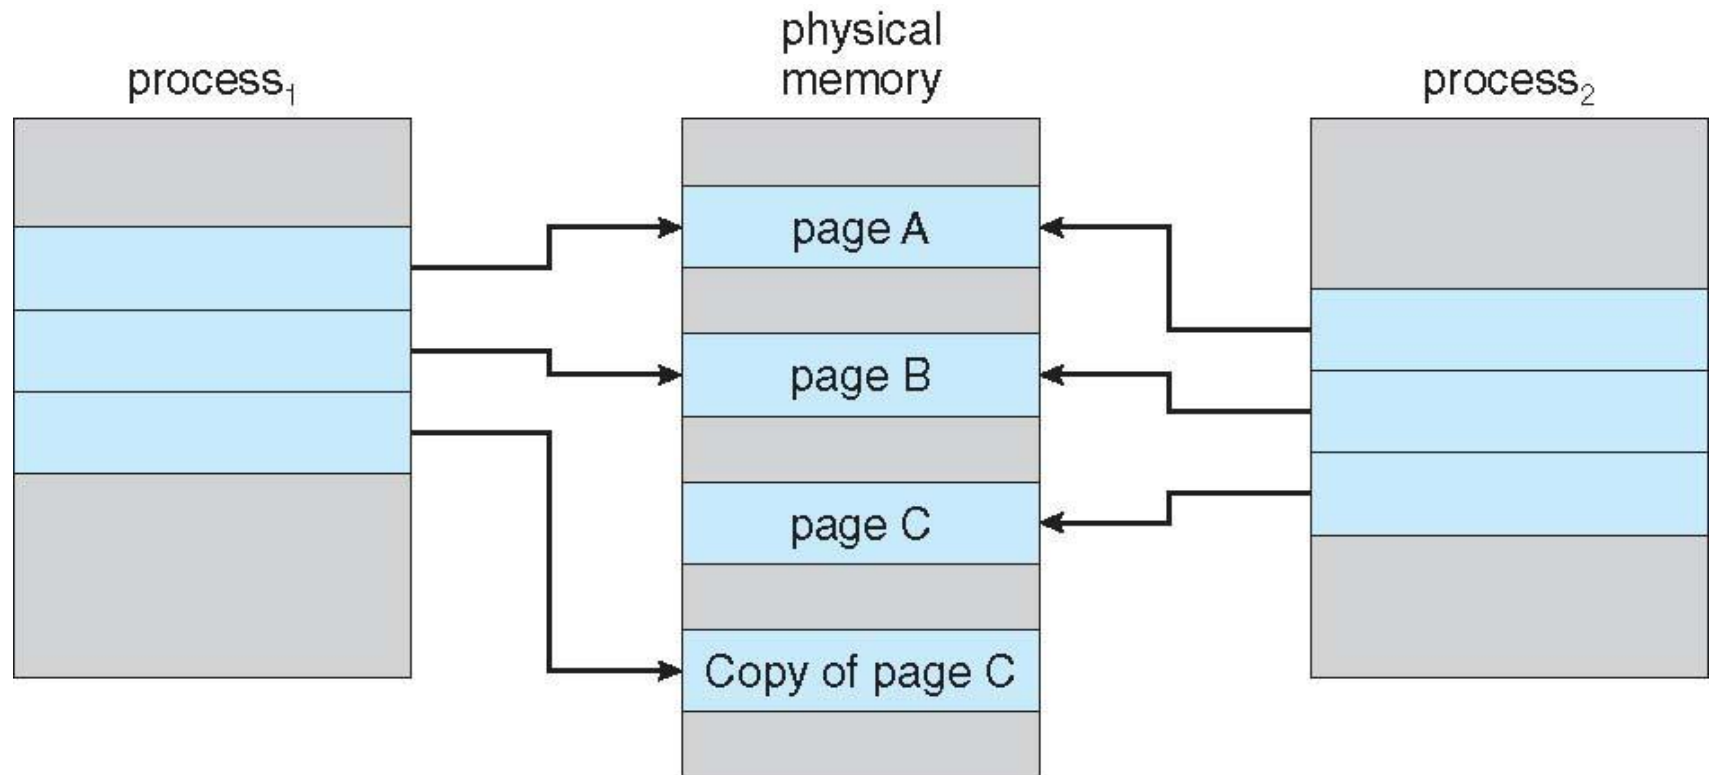

# Before Process 1 Modifies Page C

# After Process 1 Modifies Page C

# What happens if there is no free frame?

---

- Page replacement – find some page in memory, but not really in use, swap it out
  - algorithm
  - performance – want an algorithm which will result in minimum number of page faults
- Same page may be brought into memory several times

# Page Replacement

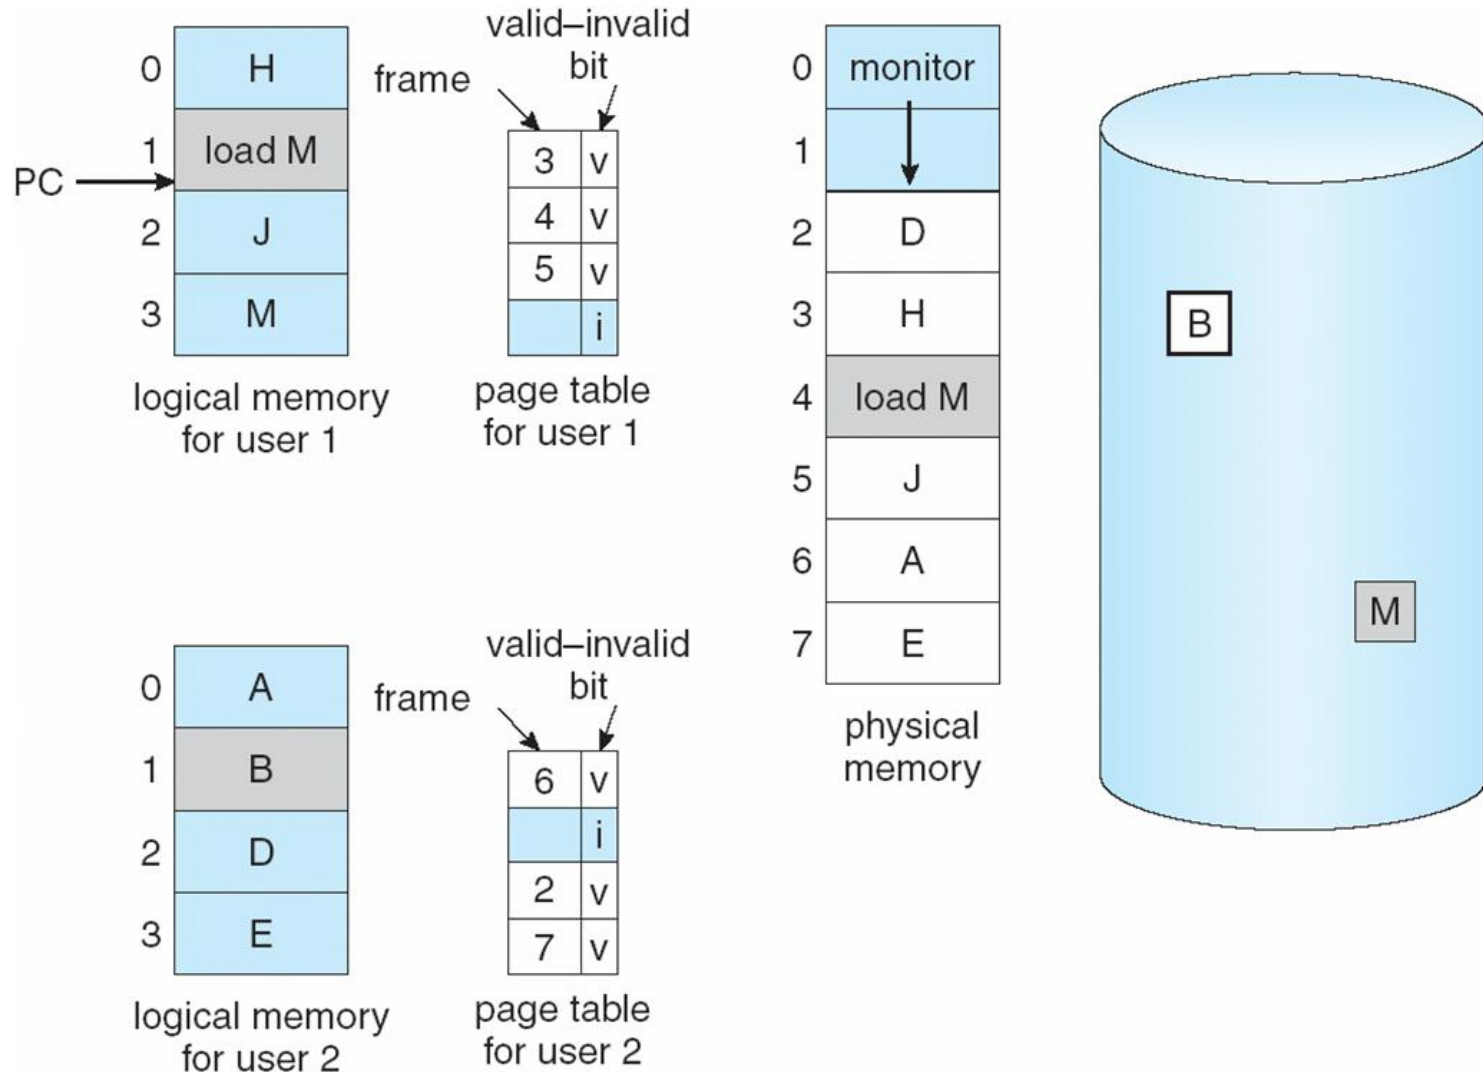

---

- Prevent over-allocation of memory by modifying page-fault service routine to include page replacement
- Use **modify (dirty) bit** to reduce overhead of page transfers – only modified pages are written to disk
- Page replacement completes separation between logical memory and physical memory – large virtual memory can be provided on a smaller physical memory

# Need For Page Replacement

# Basic Page Replacement

---

1. Find the location of the desired page on disk
2. Find a free frame:
  - If there is a free frame, use it
  - If there is no free frame, use a page replacement algorithm to select a **victim** frame
3. Bring the desired page into the (newly) free frame; update the page and frame tables
4. Restart the process

# Page Replacement

# Page Replacement Algorithms

---

- Want lowest page-fault rate
- Evaluate algorithm by running it on a particular string of memory references (reference string) and computing the number of page faults on that string
- In all our examples, the reference string is

**1, 2, 3, 4, 1, 2, 5, 1, 2, 3, 4, 5**

# Graph of Page Faults Versus The Number of Frames

# First-In-First-Out (FIFO) Algorithm

- Reference string: 1, 2, 3, 4, 1, 2, 5, 1, 2, 3, 4, 5
- 3 frames (3 pages can be in memory at a time per process)

1	1	4	5	9 page faults
2	2	1	3	
3	3	2	4	

- 4 frames

1	1	5	4	10 page faults
2	2	1	5	
3	3	2		
4	4	3		

- Belady's Anomaly: more frames  $\Rightarrow$  more page faults

# FIFO Illustrating Belady's Anomaly

# FIFO Page Replacement

reference string

7 0 1 2 0 3 0 4 2 3 0 3 2 1 2 0 1 7 0 1

7	7	7	2																
	0	0	0	2	2	4	4	4	0								7	7	7
		1	1	3	3	3	2	2	2								1	0	0
				1	0	0	0	3	3								2	2	1

page frames

# Optimal Algorithm

- Replace page that will not be used for longest period of time
- 4 frames example

1, 2, 3, 4, 1, 2, 5, 1, 2, 3, 4, 5

1
2
3
4

4

6 page faults

5

- How do you know this?
- Used for measuring how well your algorithm performs

# Optimal Page Replacement

reference string

7 0 1 2 0 3 0 4 2 3 0 3 2 1 2 0 1 7 0 1

7	7	7	2		2		2		2								7
